Q: Python efficiency when appending multiple lists I have two lists that I want to concatenate. Both lists are roughly the same size. The length of the longer list is something around 5,000,000 and the shorter list might have 20 elements. My question is now: What is the more efficient way to append the two lists: 1.) combined = [] combined.extend(x) combined.extend(y) or 2.) for x in x: combined.append(x) for y in y: combined.append(y) So, what is the most efficient way to append my two lists? A: I think the results will be almost the same but here's a benchmark: import random import time arr1 = [random.choice(range(1000)) for \_ in range(5000)] arr2 = [random.choice(range(10)) for \_ in range(10)] %timeit arr1 + arr2 1000000 loops, best of 3: 604 ns per loop %timeit arr1 1000000 loops, best of 3: 3.92 us per loop %timeit [arr1] 1000000 loops, best of 3: 594 ns per loop %timeit arr2 1000000 loops, best of 3: 1.54 us per loop %timeit [arr2] 1000000 loops, best of 3: 993 ns per loop By now, all the answers are pretty fast and I think they're pretty much equal because most of the time is spent on list.append(). Tag Archives: nome After breaking the trailhead to K'th'lt'h in two days, we had to kick it up a notch, and hike a little faster to reach Nome by the 10th of September. It was in our favor that it was also a perfect day to hike in the snow; we climbed 3,000 feet in 4 hours, traversing down through the snow bridge and up to the base of the coastal mountains, and down to the Nome and the Alaina Rivers 82157476af
